PRODUCT PROFILE

Generic Description
Modified Polyamine Epoxy

Common Usage
A low ambering, multi-purpose epoxy coating that can be used as a primer, broadcast, slurry/broadcast, mortar, grout coat, and topcoat. It provides excellent application properties with good flow and self-leveling characteristics and protects concrete surfaces from impact, abrasion and mild chemicals with an aesthetically pleasing appearance.

Colors
Supplied as a clear coat, may be field tinted with Series 821 in 16 StrataShield colors. Contact your Tnemec representative for additional information. Decorative Quartz is available in 12 standards colors, refer to the StrataShield Decorative Quartz Color card for more information. Custom colors are also available. Note: Epoxies chalk and yellow with age, extended exposure to UV and artificial lighting. Lack of ventilation, incomplete mixing, miscatalyzation or the use of heaters that emit carbon dioxide and carbon monoxide during application and initial stages of curing may cause amine blush, possibly affecting adhesion of subsequent topcoats.

Coating System
SURFACE/FILLER/PATCHER
Series 206, 215. Note: A repair kit of 201, with Part C fumed silica, is available for small patching/surfacing repairs. For more extensive repairs and additional information, contact your Tnemec representative or Tnemec Technical Services.

PRIMERS
Concrete: Self-priming or Series 201, 208, 241.

TOPOATS
Series 247, 248, 256, 284, 285, 294, 295, 206. Note: If Series 247, 248, 285, 294, 295 or 206 is selected for the finish coat, an intermediate coat of Series 284 is required. Refer to the StrataShield Installation and Application guide for floors.

Surface Preparation
Prepare surfaces by method suitable for exposure and service. Refer to the appropriate primer data sheet for specific recommendations.

Concrete
Allow new poured-in-place concrete to cure a minimum of 28 days at 75°F (24°C). Verify concrete dryness in accordance with ASTM F 1869 “Standard Test Method for Measuring Moisture Vapor Emission Rate of Concrete Subfloor Using Anhydrous Calcium Chloride” (moisture vapor transmission should not exceed three pounds per 1,000 square feet in a 24 hour period), F 2170 “Standard Test Method for Determining Relative Humidity in Concrete using in situ Probes” (relative humidity should not exceed 80%), or D 4263 “Standard Test Method for Indicating Moisture in Concrete by the Plastic Sheet Method” (no moisture present). Note: The testing listed above cannot guarantee avoidance of future moisture related problems particularly with existing concrete slabs. This is especially true if the use of an under slab moisture vapor barrier cannot be confirmed or concrete contamination from oils, chemical spills, unreacted silicates, chlorides or Alkali Silica Reaction (ASR) is suspected.

Prepare concrete surfaces in accordance with NACE No. 6/SSPC-SP13 Joint Surface Preparation Standards and ICRI Technical Guidelines. Abrasive blast, shot-blast, water jet or mechanically abrade concrete surfaces to remove laitance, curing compounds, hardeners, sealers and other contaminants and to provide a minimum ICRI-CSP 3 or greater surface profile. Large cracks, voids and other surface imperfections should be filled with a recommended filler or surfacer. Note: For moisture content exceeding 3 lbs per 1,000 sq ft or relative humidity in excess of 80%, Series 208 or 241 may be substituted for the primer. Refer to the Series 208 or 241 product data sheet for more information.

All Surfaces
Must be clean, dry and free of oil, grease and other contaminants.

Technical Data

Volume Solids
100% (mixed)

Recommended DfT
Minimum of 1/8”. Requires two broadcast applications at 1/16” each or applied as a slurry broadcast.

Curing Time

<table>

<td>12 to 24 hours</td>
<td>24 hours</td>
</tr>
</tbody>
</table>

Note: If more than 24 hours have elapsed between coats, the coated surface must be mechanically abraded before topcoating. Note: There is no maximum recoat time if aggregate has been broadcast to refusal into the preceding coat. Curing time varies with surface temperature, air movement, humidity and film thickness.

Unthinned: 0.13 lbs/gallon (15 grams/litre)

1.604 ml sq ft/gal (39.4 mi/l at 25 microns). See APPLICATION for coverage rates.

The Part C colored quartz aggregate is based on a nominal amount calculated at one-half pound per sq ft (2.4 kg/m²) per broadcast application or one pound per sq ft (4.8 kg/m²) for a double broadcast. Additional colored quartz aggregate may be required to accommodate for wear or loss during application or to make covering material.

Colorant: Series 820 field applied colorants are available in quart and gallon containers from Tnemec in 16 StrataShield colors and certain custom colors. Colorants should be added at 4 oz. to 8 oz. per gallon of mixed clear liquids for intermediate or base coats and up to 8 oz. per gallon for finish coats. Note: Color consistency and shading may vary based on the color selected and amount of colorant used.

Net Weight per Gallon
9.35 ± 0.25 lbs (4.25 ± 1.1 kg) mixed

Storage Temperature
Minimum 40°F (4°C) Maximum 90°F (32°C)
**TEMPERATURE RESISTANCE**

(Dry) Continuous 250°F (121°C)  
Intermittent 275°F (135°C)

**SHelf LIFE**

12 months at recommended storage temperature.

**FLASH POINT - SETA**

N/A

**HEALTH & SAFETY**

This product contains chemical ingredients which are considered hazardous. Read container label warning and Material Safety Data Sheet for important health and safety information prior to the use of this product.  
*Keep out of the reach of children.*

**APPLICATION**

**COVERAGE RATES**

Before commencing, obtain and thoroughly read the StrataShield Installation and Application Guide for floors.

The mixed liquids (Part A and B) are spread at a rate of 80 sq ft (7.4 m²) per gallon or approximately 20 mils (510 microns) wet. The colored quartz aggregate is then broadcast into the liquid until a uniformly dry appearance is obtained. After the first broadcast layer cures, forming a thickness approximately 1/16” (1.6 mm) thick, the excess colored quartz is removed and a second application is repeated to obtain a minimum thickness of 1/8” (3.2 mm).  
*Note:* A double broadcast is required to achieve the 1/8” (3.2 mm) minimum. For slurry application instructions and spreading rates contact your Tnemec representative.

**MIXING**

Use a variable speed drill with a PS Jiffy blade. Slowly mix 2 parts A component, and while under agitation add 1 part B component and mix for a minimum of two minutes. Ensure that all Part B is blended with Part A by scraping the pail walls with a flexible spatula.  
*Note:* A large volume of material will set up quickly if not applied or reduced in volume.  
*Caution: Do not reseal mixed material. An explosion hazard may be created.*

**Field Colorant:** Mix thoroughly using a variable speed drill with a PS Jiffy blade at a rate of 4 oz. to 8 oz. per gallon of mixed liquids.

**THINKING**

Normally not required.

**POT LIFE**

25 to 30 minutes at 75°F (24°C)

**APPLICATION EQUIPMENT**

Squeegee or trowel and backroll. For detailed instructions, refer to the StrataShield Installation and Application Guide for floors.

**SURFACE TEMPERATURE**

Minimum of 55°F (13°C), optimum 65°F to 80°F (18°F to 27°C), maximum of 90°F (32°C). The substrate temperature should be at least 5°F (3°C) above the dew point. To avoid outgassing, concrete temperature should be stabilized or in a descending temperature mode. Material should not be applied in direct sunlight.

**MATERIAL TEMPERATURE**

For optimum application, handling and performance, the material temperature during application should be between 70°F and 90°F (21°C and 32°C). Temperature will affect the workability. Cool temperatures increase viscosity and decrease workability. Warm temperatures will decrease viscosity and shorten pot life.

**CLEANUP**

Flush and clean all equipment immediately after use with xylene or MEK.
